asyncio — Asynchronous I/O

asyncio is a library to write **concurrent** code using the **async/await** syntax.

asyncio is used as a foundation for multiple Python asynchronous frameworks that provide high-performance network and web-servers, database connection libraries, distributed task queues, etc.

asyncio is often a perfect fit for IO-bound and high-level **structured** network code.

asyncio provides a set of **high-level** APIs to:

- [run Python coroutines](#) concurrently and have full control over their execution;
- perform [network IO and IPC](#);
- control [subprocesses](#);
- distribute tasks via [queues](#);
- [synchronize](#) concurrent code;

Additionally, there are **low-level** APIs for *library and framework developers* to:

- create and manage [event loops](#), which provide asynchronous APIs for [networking](#), running [subprocesses](#), handling [OS signals](#), etc;
- implement efficient protocols using [transports](#);
- [bridge](#) callback-based libraries and code with async/await syntax.

[Availability](#): not Emscripten, not WASI.

This module does not work or is not available on WebAssembly platforms wasm32-emscripTEN and wasm32-wasi. See [WebAssembly platforms](#) for more information.

asyncio REPL

You can experiment with an asyncio concurrent context in the REPL:

```
$ python -m asyncio
asyncio REPL ...
Use "await" directly instead of "asyncio.run()".
Type "help", "copyright", "credits" or "license" for more information.
>>> import asyncio
>>> await asyncio.sleep(10, result='hello')
'hello'
```

>>>

Raises an [auditing event](#) `cpython.run_stdin` with no arguments.

Changed in version 3.12.5: (also 3.11.10, 3.10.15, 3.9.20, and 3.8.20) Emits audit events.

High-level APIs

- [Runners](#)
- [Coroutines and Tasks](#)
- [Streams](#)
- [Synchronization Primitives](#)
- [Subprocesses](#)
- [Queues](#)
- [Exceptions](#)

Low-level APIs

- [Event Loop](#)
- [Futures](#)
- [Transports and Protocols](#)
- [Policies](#)
- [Platform Support](#)
- [Extending](#)
